About our How-To guides

In this section you'll find details about how you can accomplish specific tasks in Cleura and the services we support.

There are several categories of How-To guides, and they tend to be focused on a specific cloud technology.

- **OpenStack CLI/API** How-Tos cover tasks that you can accomplish with the OpenStack command line interfaces and application programming interfaces. They generally do not depend on any adjacent services or tools, just your Cleura OpenStack credentials, the `openstack` client, and/or the native OpenStack APIs.

- **Kubernetes** How-Tos cover what you can do with a Kubernetes cluster on Cleura.

- **Terraform** How-Tos deal with Terraform configurations and how you can apply them in Cleura. They build on the `terraform` binary and the OpenStack and Kubernetes providers.

- **Object storage** How-Tos deal with the S3 and Swift object storage APIs, and how you can use them for object storage in Cleura.
